Many ceramic materials, both glassy and crystalline, have found use as optically transparent materials in various forms from bulk solid-state components to high surface area forms such as thin films, coatings, and fibers. Such devices have found widespread use for various applications in the electro-optical field including: optical fibers for guided lightwave transmission, optical switches ...

Typical crystalline composition of P25 was evaluated to be 78% anatase and 14% rutile. Assuming the remaining 8% part corresponds to amorphous phase, the anatase:rutile:amorphous ratio is determined to be 78:14:8.

Graphitic carbon nitride ( $\text{g-C}_3\text{N}_4$ )-coated nickel foam is demonstrated to be highly effective for promoting uniform lithium deposition. The unique micro-electric field at the triazine units of  $\text{g-C}_3\text{N}_4$  induces numerous Li nuclei at initial nucleation stage and, subsequently, these Li nuclei guide well-distributed Li plating on 3D Ni foam.

The development of visible-light-mediated allylation of unactivated  $\text{sp}^3 \text{C-H}$  bonds is reported. The remote allylation was directed by the amidyl radical, which was generated by photocatalytic fragmentation of a pre-functionalized amide precursor.

A liquid-crystal display (LCD) is a flat-panel display or other electronically modulated optical device that uses the light-modulating properties of liquid crystals. Liquid crystals do not emit light directly, instead using a backlight or reflector to produce images in color or monochrome. LCDs are available to display arbitrary

images (as in a general-purpose computer display) or fixed images ...

Cellulose macro- and nanofibers have gained increasing attention due to the high strength and stiffness, biodegradability and renewability, and their production and application in development of composites. Application of cellulose nanofibers for the development of composites is a relatively new research area. Cellulose macro- and nanofibers can be used as reinforcement in composite materials ...

ABSTRACT. Nanocomposites, a high performance material exhibit unusual property combinations and unique design possibilities. With an estimated annual growth rate of about 25% and fastest demand to be in engineering plastics and elastomers, their potential is so striking that they are useful in several areas ranging from packaging to biomedical applications.
