Phenylalanine is converted to cinnamic acid by the phenylalanine ammonia-lyase (PAL). Cinnamic acid is subsequently hydroxylated by the cinnamic acid 4-hydroxylase (C4H, CYP73) yielding p-coumaric acid. p-Coumaric is activated to its CoA thioester p-coumaroyl CoA by the 4-coumarate:CoA ligase (4CL). CYP84, the ferulate 5-hydroxylase (F5H), is involved in the biosynthesis of both guaiacyl and sinapyl lignin monomers.

The present work focuses on the topochemical photoconversion process in which $\hat{I}\pm$ -trans-cinnamic acid becomes $\hat{I}\pm$ -truxillic acid. This solid-state [2 + 2] cycloaddition reaction has previously been studied with X-ray diffraction, atomic force microscopy, and vibrational spectroscopy.

The chemistry of cinnamic acids and related compounds has been studied. In superacid-catalyzed reactions with arenes, two competing reaction mechanisms are proposed. Both mechanisms involve the formation of dicationic intermediates (superelectrophiles), and the reactions can lead to either chalcone-type products or indanone products.
